

Probe Station Systems

The MicroPoint laser provides deprocessing/removal of passivation and other materials for probing at the smallest sites.

Circuit isolation can be achieved on diffraction limited structures and at specific levels of integration without any collateral damage

Retrofit kits are available to mount the MicroPoint Laser to most probe station microscopes, including Mitutoyo.

Complete probe station solutions are also available, including probe station, high resolution microscope, video and/or emission analysis system, and MicroPoint Laser System.

Probe station accessories are also available.
